

Requires SC-500 parts set.

Super Blower

This circuit is similar to project 11 but uses both sets of batteries to spin the motor very fast, so **BE VERY CAREFUL**.

Push the press switch until the fan reaches full speed. When you release it the fan will lift off and fly through the air. **DO NOT TOUCH** the motor or fan while they are spinning. **DO NOT LEAN** over the motor.

The diode (D3) reduces the motor speed a little.

This circuit was created by Nathan from Colorado.

! **WARNING:** Moving parts. Do not touch the fan or motor during operation.

! **WARNING:** Do not lean over the motor.
